

VIJAY CHOUHAN

Senior Full Stack Developer

er.vijaychouhan88@gmail.com | +91 881-738-5880 | Indore

PROFESSIONAL SUMMARY

Senior Software Engineer | Full Stack Engineer building production web platforms in **React.js, Next.js, Node.js, and TypeScript** across SaaS, fintech, ticketing, ed-tech, and real estate products. Delivers end-to-end features from **GraphQL API design and AWS serverless** backend work to responsive frontend state management with Redux and React Query. Strengthens releases through type-safe code generation, real-time systems, and code quality pipelines.

SKILLS

Technical Skills: JavaScript (ES6+), TypeScript, React.js, Next.js (SSR/SSG), Node.js

Engineering Leadership: Technical mentoring, Code review standards, Solution architecture, Incident management, Cross-functional collaboration

Delivery Operations: Agile Scrum, Stakeholder communication, Release planning, Project estimation, Technical decision making

PROFESSIONAL EXPERIENCE

Senior Software Developer | Full Stack Developer | Thoughtwin IT Solutions - Indore, Madhya Pradesh

09/2021 - Current

- Built full-stack features in React.js, Next.js, Node.js, and TypeScript across production client engagements, from architecture through deployment, using Redux/React Query for state management and enforcing TypeScript typing standards for maintainability.
- Built responsive UIs with Material-UI, Tailwind CSS, and SASS; integrated Google Maps/Places APIs for location-based features; collaborated closely with backend and DevOps engineers on end-to-end delivery, from API design to CI/CD, following Agile/Scrum practices.
- Designed a NestJS + GraphQL (Apollo, schema-first) backend combining social features (posts, comments, follows), real-time chat/video calling, and tutoring class bookings.
- Implemented Stripe escrow payments with commission, refund, and fraud-hold policies for session bookings, enhancing transaction security and user trust alongside a guardian/child account system with granular privacy controls.
- Built a self-hosted real-time chat and calling stack using Socket.IO with a Redis adapter and mediasoup (SFU) for WebRTC, migrating off a third-party provider to reduce cost and gain control.
- Engineered BullMQ background job processing for notifications and async workflows, custom GraphQL schema directives for authentication/RBAC, and covered core flows with Jest unit tests.
- Built backend services in Rust and Node.js on AWS Lambda, AppSync (GraphQL), and DynamoDB single-table design for a serverless property management ecosystem.
- Integrated Cognito authentication, S3, SQS async processing, OpenSearch, and SES/SNS notifications to streamline user management and improve system responsiveness; utilized Google Gemini for AI-generated content.
- Automated deployments and dependency security scanning with GitHub Actions and Dependabot.

Sootra - SaaS Productivity Platform & Admin Dashboard

- Architected dual-frontend Retool UI + TypeScript + Vite applications (user portal and admin dashboard) sharing a common design system.
- Integrated Monaco Editor and GraphQL for code-based and drag-and-drop content workflows; used Redux Toolkit and React Query for state and server-data synchronization.
- Set up ESLint, Prettier, Husky, and SonarQube pipelines to enforce code quality; added Socket.io for real-time updates and notifications.

MyTicketPartner - White-label Event Ticketing Platform (Next.js)

- Built white-label, multi-tenant architecture with Next.js dynamic routing and custom subdomains, enabling organizations to easily launch and manage branded ticketing sites.
- Developed a multi-step event creation wizard (ticket tiers, seating layouts, tax/fee configuration, promo codes) and a Stripe-based checkout handling tiered pricing and timed cart holds.
- Improved performance and SEO with Next.js SSR/SSG; added i18n for multi-language support and enforced linting/formatting standards across a large team.

CRED-iQ - Financial Data & Geospatial Analytics Platform

- Reduced runtime errors by 40% by integrating GraphQL Code Generator to keep TypeScript interfaces in sync with the API schema.
- Implemented Redux-Observable (RxJS) middleware for concurrent data fetching, cancellation, and debouncing in async flows.
- Secured the application with Auth0-based RBAC and deployed via AWS CLI to S3/CloudFront across Dev, UAT, and Live environments.

EDUCATION

Institute of Engineering & Technology, DAVV - Indore

Bachelor of Engineering (BCA): Computer Science

CERTIFICATIONS

- C/C++ (Universal Infotech, India)
- Python (HackerRank)
- React (Great Learning)
- React (HackerRank)
